Introduction

In 1989, a systematic evaluation of woody and herbaceous perennial landscape plants was begun at the University of Alaska Fairbanks Georgeson Botanical Garden ($64^{\circ}51'N$, $147^{\circ}52'W$). The purpose of this research is to identify hardy perennials capable of surviving in subarctic environments; to evaluate the ornamental potential of these plants; and to fulfill a growing demand for information on hardy landscape plant materials by home owners, commercial growers, and landscapers.

The collection includes both indigenous and non-indigenous species that were obtained as plants or propagules from wild stands, botanical gardens, plant materials centers, and commercial nurseries in North America and the circumpolar North (Appendix 1). When available, ten plants of each herbaceous perennial ornamental will be evaluated for a minimum of five years, and five plants of each woody landscape plant will be evaluated for 10 years. Subsequently, hardy perennials will be propagated and tested at other locations throughout the Interior and released for commercial propagation.

Plants are grown in the Herbaceous Perennial and Woody Ornamental Test Garden in the Georgeson Botanical Garden (see map on the last page) on a south-facing slope, elevation 475 - 487 feet. Soils are Fairbanks silt-loam that have been under cultivation since about 1910. Soils were amended with 1-2 inches of Lemeta peat in 1988. All plants receive full sun (a shade house will be completed in 1992) and are watered with overhead irrigation as needed. Weed control is primarily by hand and rototiller. In May 1991, Surflan® herbicide (60 gal/A) was applied to established plantings, but additional hand weeding was necessary. Unless otherwise noted, plants received no special winter protection such as mulching or screening.

Weather data is compiled annually from a U.S. Weather Service station (elevation 475 ft) located approximately 350 ft west of the test garden. A summary of pertinent weather statistics for 1989 through 1991 is shown in Table 1.

Plant Evaluation Tables

The information is summarized in three tables. Table 2 lists all the plant materials currently being evaluated. Table 3 lists all plants that have been evaluated but did not survive the minimum five-year evaluation period for herbaceous perennials and grasses or the minimum ten-year evaluation period for woody landscape plants. Table 4 lists current year's plantings that have not yet been evaluated for winter survival. Each of the three tables is further divided into three sections: herbaceous perennials, ornamental grasses and woody landscape plants.

Explanation of Tables

SCIENTIFIC NAME : The following references listed in order, were consulted for scientific names:

L.H. Bailey Hortorium. 1976. *Hortus III*. MacMillan Publishing Co., NY.

Fernald, M.L. 1970. *Gray's Manual of Botany*. 8th ed. D. Van Nostrand Company, NY.

Hultén, E. 1974. *Flora of Alaska and Neighboring Territories*. Stanford University Press, CA.

Harkness, M.G. and D. D'Angelo, eds. 1986. *Bernard E. Harkness Seedlist Handbook*. Timber Press, Portland.

Bluebird Nursery, Inc. 1990. Catalog. Clarkson, NE.

SOURCE : This column lists the private individual, botanical garden, agency, organization or commercial business that provided the plants or propagules. Complete names and addresses for the commercial sources and organizations are listed in Appendix 1.

NUMBER OF PLANTS : The total number of plants evaluated.

WINTER INJURY : A visual rating of winter injury was recorded each spring beginning in 1990. Data represent an average rating for the total number of plants evaluated using the scale listed below. Data are cumulative over all the years plants were evaluated.

0 = no visible injury

1 = slight winter injury

2 = moderate winter injury, recovery likely

3 = severe setback from winter injury, recovery questionable

4 = winterkilled

HEIGHT AND SPREAD : The maximum height and spread of herbaceous perennials and ornamental grasses and the average height and spread of woody landscape plants was recorded each summer. Some plants showed a significant difference in height between foliage and flowers/seed pods. For these plants, the first number listed is the foliage height, and the number in parentheses is the flower/seed pod height.

FLOWERING PERIOD : The flower symbol * in each column denotes the weeks in each month when plants were flowering. For ornamental grasses, only the first observation of flowering is noted because the flowers are insignificant and the seed heads are usually present until snowfall. The fruit symbol # in the woody landscape plants section indicates the weeks when ornamental fruits are present.

FROST TOLERANT : A plus sign in each column indicates that the foliage or flowers of a particular plant showed no obvious damage after the first frost (+29°F on Aug 27 1991). A negative sign indicates frost damage.

PLOT LOCATION : The number in this column indicates the plot in the test garden where the specific test plants are located. Refer to the map on the last page of this publication for the physical location of each plot.

NUMBER OF YEARS SURVIVED : The total number of years that one or more of the plants being evaluated survived. Causes of plant death could be winterkill, improper site conditions, inadequate or improper field management practices, or mechanical injury. Suspected cause for a particular species or cultivar, if known, is listed in code in the comments section. Codes are defined in a footnote at the bottom of each page.

Acknowledgments

We gratefully acknowledge the assistance of the following employees and volunteers who helped plant and maintain the research test gardens:

Judy Binkley
Karen Binkley
Michael Brase
Phillip Bruden
Virginia (Ginger) Gauss
Tryntje Helfferich
Brad Hodges
Eli Kilapsuk
Melinda (Milly) Korth
