Expert Research Equipment Manufacturing at the GI

The GI Instrument Development Services (IDS) has manufactured and tested a variety of sensors, devices and vehicles in their machine and electronic shops. Recently, a prototype rocket was built and launched from Poker Flat Research Range to test equipment for Dartmouth College researchers.

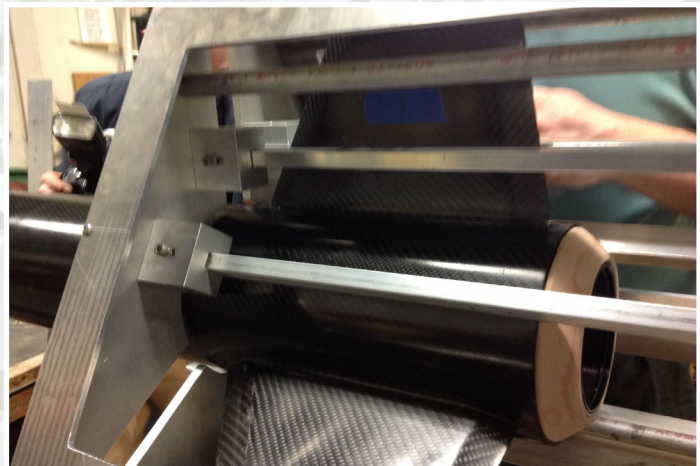

IDS is equipped with reliable manufacturing equipment including a 3-D printer, and offers expertise in designing, manufacturing and testing devices to meet the operational challenges of an arctic climate.

IDS will give a presentation of their services. A tour of their shops will follow.
